# **Autonomous Commissioning**

**The Foundation for Smart Building Success** 

### About me

**Saheel Chandrani** Co-founder & CEO

- Motivated to improve the lives of the people who serve the buildings we 1 live and work in.
- 2. 20 years in BAS/Controls industry, experience at ABB, Honeywell, JCI, and Siemens.
- 3. 2x BS, Mechanical Engineering + Management NJIT
- MBA Drexel 4.
- Home: Princeton, NJ 5.
- Office + team: Farmingdale, NY 6.

## Agenda

- 1. System Integrators perspective
- 2. Importance of standardization for other applications
- 3. The problem we solve
- 4. Some examples of success
- 5. Questions

### **A System Integrator's perspective**

# **Commissioning: it's a critical foundation**

**Problem Statement:** Smart building applications fail without properly commissioned systems

### **Reality Check:** 2.

- Greater than 50% of first year building faults stem from incomplete commissioning, resulting in a median whole-1. building energy loss of 16%
- Majority of work performed by small/medium System Integrators, utilizing traditional tools and methodologies 2.
- Traditional procurement models leads to multi-vendor, multi-protocol, and multi-generational implementations 3.

### 3. Integrators dilemma:

- **Construction Tiers:** BAS integrators often 3-4 tiers removed from owner 1.
- **Timeline Pressure:** Last in the construction sequence, first to face schedule compression and trade dependence 2.
- Budget Constraints: Expected to absorb upstream delays without additional compensation 3.
- **Technical Demands:** Integrating diverse systems from multiple manufacturers 4.
- **Opportunity:** Thorough commissioning creates the bedrock for all other smart building technologies 5.

# The standardization imperative

### **Integration Challenge:** 1.

- Multi-generational + multi-vendor installations
- Inconsistent installing contractor processes 2.
- Data Context: Raw point names vs. semantic 2. understanding
- **Scalability Issue:** Proprietary naming conventions don't scale across enterprises
- 4. Analytics Foundation: Consistent tagging enables advanced analytics and AI applications- best suited during the initial implementation of building technology

- Lives on the BAS network as an Administrative user; is performing tasks and recording results much like a user normally would, however, able to do this automatically
- 2. BAS and HVAC system databases and documentation imported into Cx tool
- Tool leverages parser engine + tagging to automatically homogenize and 3. normalize data, automated test sequences are selected and customized, assigned to the appropriate project, and scheduled for execution
- 4. Data is collected and analysis engines computes results
- Reporting and documentation provided for variety of stakeholders 5.

# **Key differences from FDD**

(Fault Detection and Diagnostics)

### FDD

### **Trend based**

Passive monitoring with rule-based or model-based anomaly detection against trend data

### **Reference baseline**

Compares against learned normal operation

### Learns to be effective

Trends and algorithms must observe and learn over several weeks before system can be effective

### Data dependent

Based on data quality, accuracy, and reliability

### **Autonomous Commissioning**

### **Real-time Functional Testing**

Automated functional testing and verification of current operating condition for all equipment types

### **Test and Verify**

Compares against design docs, specs, and SOO

### Effective from Day 1

Can deploy and begin testing on Day 1, delivering results instantaneously

### **Condition dependent**

Analyzes currently observed reactions

# Autonomous Cx ensures FDD algorithms learning from properly commissioned systems to enable high performance buildings

# Cast study: Large commercial office building

# **Commercial office building – New York, NY**

### **Project overview:**

- 46 story, 990,000sqft, 19,007 points midtown Manhattan
- Niagara front end JCI Metasys + FX across base building + several tenant BAS implementations 2.
- Chief engineer new to the building, strong concerns that 'things aren't working' and we 'have to override everything' З.
- While many energy efficiency projects implemented, still room for improvement 4.
- 5. Incumbent controls contractor facing heavy lift to normalize data across many installations, struggled to perform service work. Labor effort seemed overwhelming.

### **Project goals:**

- Perform baseline analysis of 'how are my systems working' 1.
- 2. Perform a thorough seasonal recommissioning of the BAS
- Create a unified points list across all base building + tenant systems to allow future technology deployments 3.

### **Implementation** approach

# Fall-Winter 2024 seasonal test result

- 1. Total of 3,143 automated functional tests were run, delivering 72% success score.
- 2. Tool runtime: 2 days 4hr 5 min; Labor saved: 120hrs+
- 3. 100% testing and validation of:
  - 1. Chilled Water System (CH-1, 2, 3, CHWP-1, 2, 3, 4, 5, CWP-1, 2, CT-1, 2, 3, + VFDs)
  - 2. 8 AHUs (S-1, 2, 3, 4, 5, 6, 9 & R-5, 6, 7, 8, 9, 10 + VFDs)
  - 3. ~600 Terminal units (VAVs + PIUs)

# **Results highlights**

- **Energy: Automated Control Limitations** 
  - AC units are improperly locked out of heating/cooling modes based on rigid outside air temperature thresholds 1.
  - Supply air temperature reset functionality is limited by hard-coded values 2.
  - Winter mode (warmup) sequences activate unnecessarily and remain engaged without proper reset capabilities 3.
  - Floor dampers require manual adjustment due to poor automatic control 4.
- Comfort: Sensor and Measurement Issues 2.
  - Significant discrepancies (20°F+) exist between outside air temperature sensors 1.
  - Return/mixed air temperature sensors provide poor representation of actual zone condition 2.
  - 3. VAV boxes become stuck in purge mode without manual intervention
  - CFM measurements appear inaccurate, leading to improper air distribution 4.
- Safety: Safety and Scheduling Concerns 3.
  - At least one freeze-stat safety device was found bypassed, creating potential system damage risk 1.
  - PIUs (Powered Induction Units) operate continuously instead of following floor occupancy schedule 2.
  - Inconsistent control methodologies exist across different building floors З.

# **Energy impacts**

	Concern	Est. Annual Energy Impact (\$)	Est. Annual End
1.	AC Units are hard coded to enter Economizer mode	\$11,826	
2.	Economizer lockout	\$50,640	
3.	OAT Sensor Discrepancy	\$60,000	
4.	Hard-coded Supply Air Setpoints	\$18,600	
5.	VAV Purge Mode	\$9,358	
6.	PIU without Setback	\$84,450	
	TOTAL	\$234,874 potential savings	1,949.

### ergy Impact (Tons CO2)

- 138.4
- 592.3
- 432.6
- 109.9
- 37.3
- 638.8
- .3 Tons of CO2

### Case Study 2: College campus

# College campus – Hoboken, NJ

### **Project overview:**

- Prestigious engineering college with 43 academic, housing, and administrative buildings across 55 acres, approx. 1.7m sqft, 27,000+ pts (5 bldgs.)
- Niagara front end Honeywell WEBs + JCI FX, by several installing contractors over many new construction, retrofit, and upgrade projects leading to inconsistent naming convention and sequences across similar equipment types.
- Many comfort complaints and new Controls contractor on site managing service facing many issues 3.
- Needed a thorough ReCx across campus BAS + workorder management to track issue resolution 4.

### **Project goals:**

- Establish a unified and homogenized campus BAS points list & standardize campus sequences 1.
- 2. Utilize Autonomous Commissioning platform to perform baseline understanding of current operating condition of equipment against design guidance
- Integrate with existing work-order management system 3.

### **Implementation** approach

Cx process is initiated and completed

Results presented to Service Provider for resolution

# Implementation notes

- Working with campus IT department, Autonomous Commissioning platform was provided with appropriate credentials 1. and virtual machine for data aggregation
- Also delivered through partner, perform pilot across 5 buildings before campus wide rollout 2.
- Existing supervisory controller databases imported, automatic point discovery and homogenization process completed З. point naming standardization
- In collaboration with retained MEP consulting engineer, updated sequences of operation established, and appropriate 4. tests were written

# Initial results – 1 bldg.

- Total of 1,034 automated functional tests were run, delivering 84% success score. 1.
- Tool runtime: 11hr 19 min; Labor saved: 120hrs+ 2.
- 100% testing and validation of: Boiler (3), CHW Plant (1), CleanBench (5), Exhaust Fan (10), FCU (8), Flow Meter (9), Heat З. Wheel (3), HV (2), HW Plant (5), VAV (83), VFD (22).
- Unified points list total: 27k + (across 5 buildings) 4.

Result: 153 failed (860 succeeded)							
Success Rate	Tests	Succeeded	Failed	Pending	Ignored	Skipped	Duration
84%	1034	860	153	13	0	8	11:19:36.4

### Sample test result

### Execution Details

**Scenario:** Return Duct Static Pressure Sensor 11/22/2024 19:54:14 (in ACS\_UR\_1\_AC Unit\_ACS\_UR) *Tags: @Screenshot, @pointtopoint* 

• Start Time: 11/22/2024, 2:54:14 PM

Steps	Trace	Result
Given no preconditions	FrameworkSteps: Trace Level = Info.	Succeeded in 0.967s
Then 'ACS_UR_1.RA_P' should be between '0 inWC' and '2 inWC'	Failure: ACS_UR_1.RA_P (-0.04) should be between 0 inWC (0) and 2 inWC (2) Screenshot URL: https://155.246.10.134/ord/station: slot:/Drivers/NiagaraNetwork/UCC_MCP2/points/AC	Failed in 1.181s

# **Results highlights**

- ReCx of all 5 buildings in <2 weeks by team of 2 1.
- 2. Estimated \$400k annual energy savings from easy to implement corrective actions across 5 buildings; near instantaneous ROI.
- Unified points list + ReCx'd buildings allow for deployment of FDD and other analytics platforms З.

May 1, 2025
